Bone and joint imaging is also known as skeletal scintigraphy or bone scan. In this exam, a small amount of radiopharmaceutical is injected into the bloodstream. It accumulates in areas of the skeleton where bone is being remodeled due to injury or disease.

Bone & Joint Metabolic Imaging - ARA Diagnostic Imaging

In orthopedics, an MRI may be used to examine bones, joints, and soft tissues such as cartilage, muscles, and tendons for injuries or the presence of structural abnormalities or certain other conditions, such as tumors, inflammatory disease, congenital abnormalities, osteonecrosis, bone marrow disease, and herniation or degeneration of discs of the spinal cord. MRI may be used to assess the results of corrective orthopedic procedures.

A whole body bone scan takes around 3-4 hours, which includes two separate visits. In the first visit you will be given an injection of a radioactive isotope into a vein in your arm. There are no side effects to this injection. The isotope takes 2-3 hours to circulate in the blood and get absorbed in the bone.
