Choice of multivariate statistical test depends upon the type of categorical outcome. Multivariate statistics for categorical and ordinal outcomes are different from traditional multiple regression models. The primary inferences yielded from multivariate statistics for categorical outcomes are adjusted odds ratios with 95% confidence intervals.

Multivariate statistics are used to account for confounding effects, account for more variance in an outcome, and predict for outcomes. Multivariate statistics allows for associations and effects between predictor and outcome variables to be adjusted for by demographic, clinical, and prognostic variables (simultaneous regression).
