Prostate cancer - Symptoms and causes - Mayo Clinic

Screening may find cancer that is likely to spread to other places in the body, so it can be treated before it spreads. This may lower the chance of death from prostate cancer in some men. But most prostate cancers grow slowly and don't cause any health problems.

Prostate Cancer Awareness Feature | CDC

Prostate cancer stages are indicated by Roman numerals ranging from I to IV. The lowest stages indicate the cancer is confined to the prostate. By stage IV, the cancer has grown beyond the prostate and may have spread to other areas of the body.

Prostate cancer - Diagnosis and treatment - Mayo Clinic

Prostate cancer develops in the prostate gland, a part of the male reproductive system. Many men choose active surveillance (no treatment) because prostate cancer tends to grow slowly and stay in the gland. For cancers that grow fast and spread, treatments include brachytherapy (internal radiation), prostatectomy surgery and focal therapy.

Greater prostate cancer incidence; mortality among Black ...

As you may have heard, baseball legend Cal Ripken Jr. received a prostate cancer diagnosis back in February and is now cancer-free. For that swift and positive outcome, he credits a new, non-invasive urine test that led him to proactively seek a biopsy — something he wants other men to know is available to them, too.

Non-Invasive Prostate Cancer Test Boosts Early Treatment

Prostate cancer is cancer of the prostate. The prostate is a gland in the male reproductive system that surrounds the urethra just below the bladder. Most prostate cancers are slow growing. Cancerous cells may spread to other areas of the body, particularly the bones and lymph nodes. It may initially cause no symptoms.

Prostate cancer - Wikipedia
