Surgical Pathology < Pathology

INTRODUCTION. Primary malignant liver tumors resemble and arise from the major constituent cells of the liver, namely hepatocytes (giving rise to hepatocellular carcinoma), biliary epithelial cells (cholangiocarcinoma and biliary cystadenocarcinoma), endothelial cells (angiosarcoma, epithelioid hemangioendothelioma), or combinations of these cells with various mesenchymal cells (eg, hepatoblastoma) [1].

UpToDate

Liver cancer is mainly composed of dense cancer nest tissues and can invade surrounding tissues to induce hyperplasia and the adhesion of surrounding tissues, thereby increasing hardness. Therefore, Young modulus

of liver cancer is higher than those of hepatic hemangioma and normal liver tissues.

Diagnosis of liver tumors by multimodal ultrasound imaging ...

The tumor cell trabeculae in HCC are separated by a network of vascular channels lined by endothelium. The tumor cells have round to oval enlarged nuclei, prominent nucleoli, and abundant eosinophilic cytoplasm with lipid droplets (fatty change). Note the compressed non-neoplastic liver adjacent to the tumor with smaller, more uniform hepatocytes.
